

Project Overview

Project: Corporate Announcement Process

Industry: Retail

Customer Profile

It's the largest chain of convenience stores from Mexico with over 11000 stores across Latin America.

Requirement

The convenience stores are spread across the Nation; therefore, when it comes to making an announcement or disbursing any important message to all the stores for change in the commercial terms of any Product then it used to become hassle for the Head Office. As there was no predefined format for communicating any change in regards to the Product Pricing. It used to be shared directly through email which caused traffic saturation in servers and lacked control of addresses.

These announcements were vital for the business because they included changes in prices and/or discounts for products and inputs sold or used in the retail stores, as well as important information for daily operation. Customers were not having any system or tool through which these announcements can be tracked.

Solution:

The announcements have been broadly segregated into two parts; one is the Commercial Announcement and other is the Administrative or Operational Announcement.

Process for Commercial Announcement

All the commercial announcements are registered in their accounting system which then gets approved by the Authorized person. Once it is approved, then it comes automatically into SharePoint

Application built by Adapt. A schedule job is written for this process which fetches the approved commercial announcements from Oracle (Accounting System) to the SharePoint Application.

When commercial announcements come into SharePoint Application then the Reviewer will review the commercial announcement in a consolidated screen and assign the addressee to whom it needs to be sent. After assigning the addressees', the reviewer will release the announcements which will then be sent to the corresponding people involved through email in a consolidated view.

Process for Administrative or Operational Announcement

Administrative or Operational Announcements are not obtained from Accounting System. A provision has been made in the SharePoint Application to register informative announcements. Once the announcement is registered it will be sent to the Approver who will approve these announcements on the basis of which it will be released to the addressees' in the consolidated view through email.

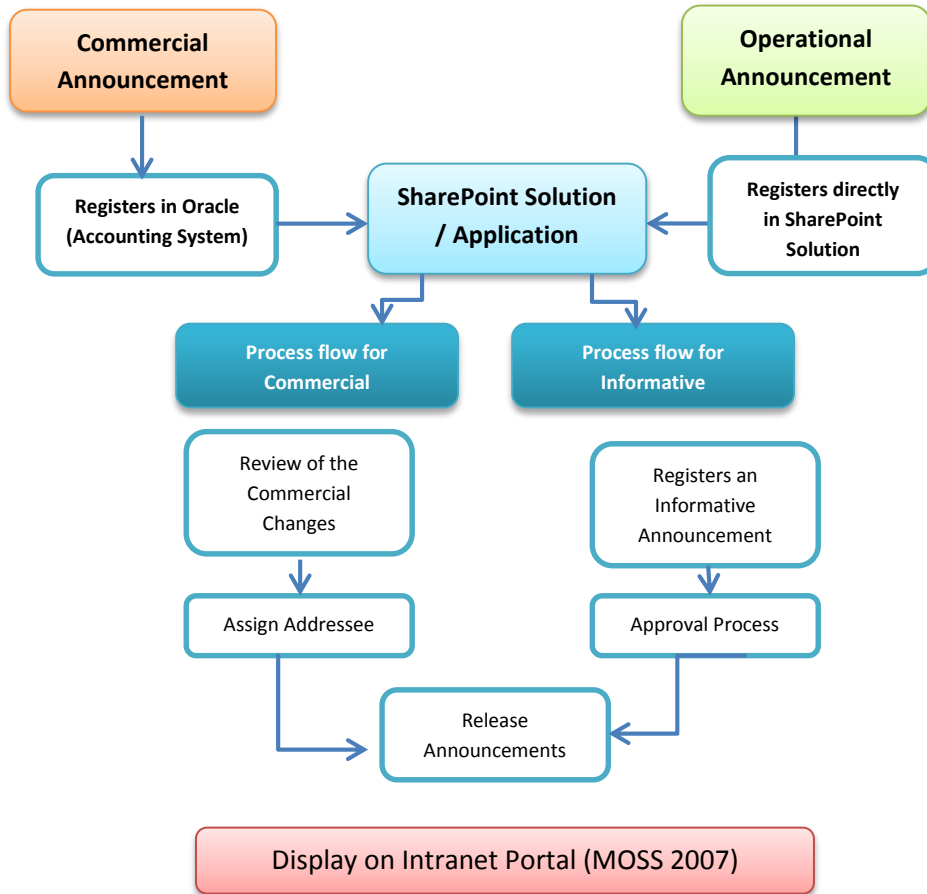

Once the commercial and informative announcements are released from the SharePoint Application, the same gets displayed on Client's intranet which is running on MOSS 2007 technology. To achieve this, the integration has been done between SharePoint 2010 to MOSS 2007 by using MOSS 2007 web services.

Technical Explanation: Two Integrations have been done.

1. **Oracle (Accounting System) to SharePoint:** A scheduled job is written to fetch the commercial announcement from customer Accounting system to SharePoint Application.
2. **SharePoint 2010 to MOSS 2007:** Other integration has been done to display the release announcement on customer Intranet portal which is running on Moss 2007.

Technology Used: The complete solution has been customized by using technology SharePoint 2010, MOSS 2007, MOSS 2007 Web Services.
